- 100% Availability for Redundant Architecture
- 24-Hour Policy Change
- 8-Hour Hardware Response and Recovery

Shared Firewall Service

- 100% Satisfaction
- 48-Hour Policy Change
- 8-Hour Hardware Response and Recovery

A Solid Foundation

An effective and reliable firewall is an essential part of any network security program. Enterprise Hosting's managed firewall service is built upon a foundation of industry-leading hardware and software platforms from Cisco. Cisco was selected specifically for their proven track record, performance history and overall reliability. This solid security platform allows Enterprise Hosting's managed security team to deliver the best available security management.

Each of Enterprise Hosting's managed firewall services offers stateful inspection technology, the industry standard in network security. With stateful inspection, the firewall scans all Web traffic attempting to cross your Internet gateway. Traffic that fails to comply with your defined policy is immediately blocked and discarded.

Dedicated Staff Around the Clock

Hardware and software are only part of the solution. Effective firewalls require sophisticated management. However, it is challenging and expensive to find, train and retain IT professionals with advanced security management expertise. Enterprise Hosting provides a staff of Cisco and Global Incident Analysis Center (GIAC) certified security technicians dedicated to maintaining your network security.

Multiple Firewall Options

Multiple managed firewall options are available to meet the needs of your growing company. We offer platforms that vary by your throughput, port, redundancy and SLA requirements.

Shared Firewall Service

Shared Firewall Service is by far the most cost effective, although your security infrastructure will be utilized for multiple customers. Enterprise Hosting offers this configuration with the Cisco 515 UR.

Single Firewall Options

A single configuration firewall protects your network against unauthorized access. Enterprise Hosting offers this configuration with Cisco PIX 515s, 525s or 535s. Each is customizable to meet your throughput level requirements.

Redundant High-Availability Firewall Options

For customers requiring a fully redundant firewall architecture, the high availability configuration is an ideal complement to Internet 3.0, our multi-homed Internet access service. The high availability services can be configured using Cisco PIX 515s, 525s or 535s.

Personalized Security Policies

While only you can determine the best security policy for your business, Enterprise Hosting's managed security team can help. We provide professional support guidelines and tools for policy-building standards to all of our customers.
